

Shape from Profiles

Roberto Cipolla and Kenneth Wong
Department of Engineering

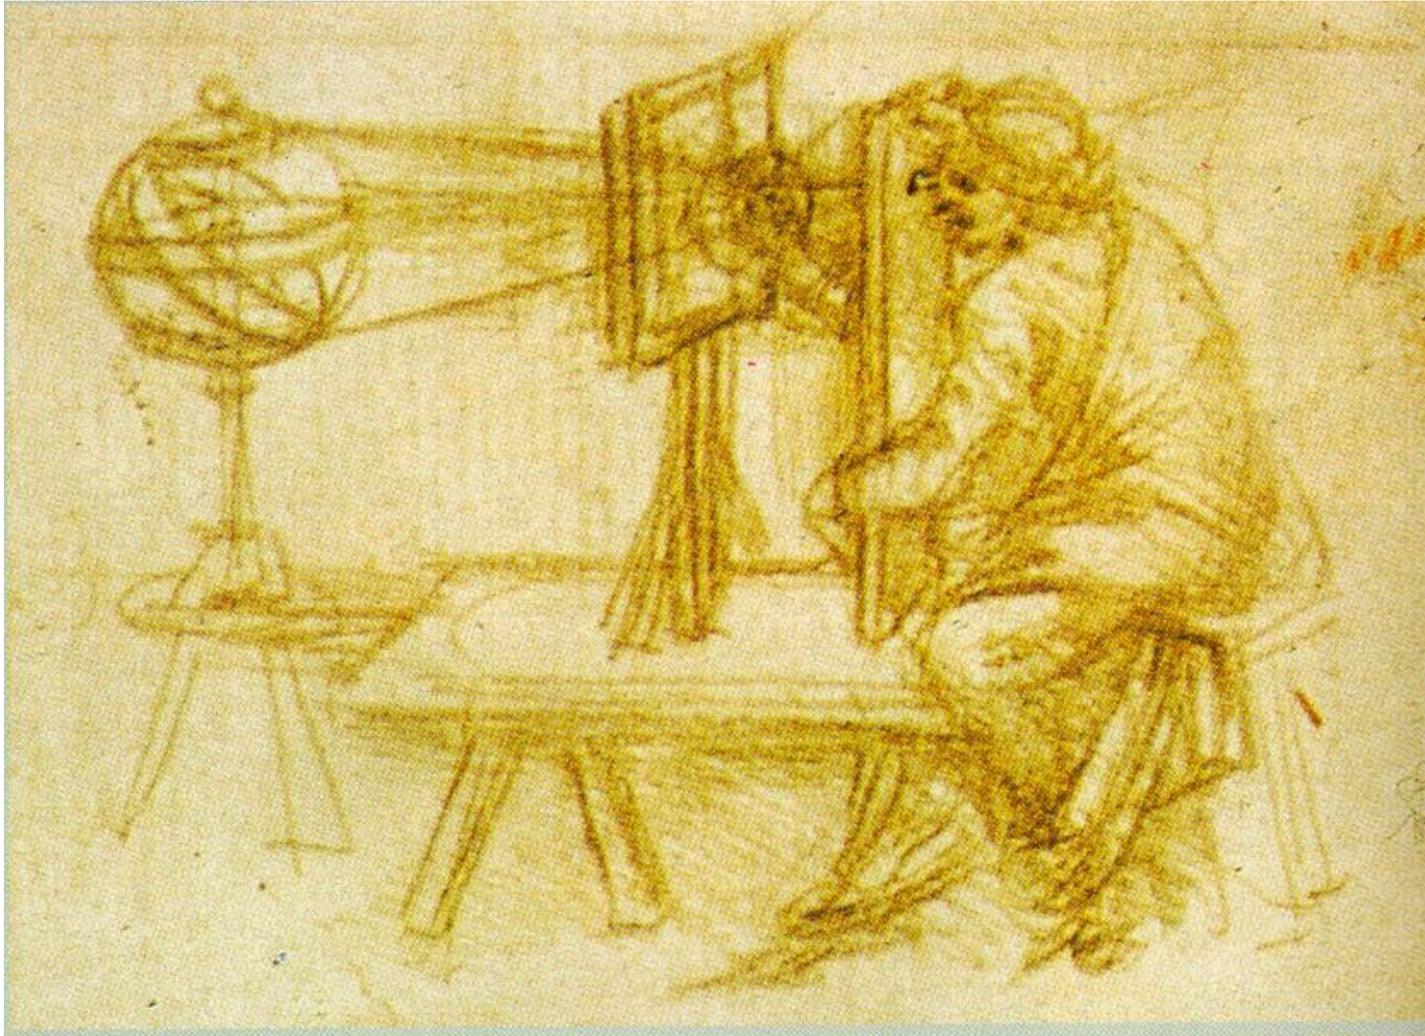

Motivation

3D model acquisition

Perspective

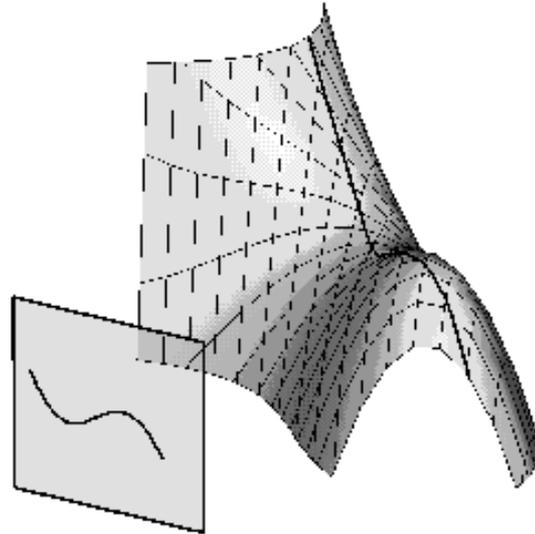

Overview

- Review of reconstruction from profiles
 - Tracking with B-spline snakes
 - Epipolar geometry
- Review of recovery of motion from profiles
 - Epipolar geometry from frontiers
 - Circular or turntable motion
- Realtime practical system
 - Trivial initialization using circular motion
 - Addition of arbitrary uncalibrated views
 - Octree generation and voxel carving

Shape from Profile

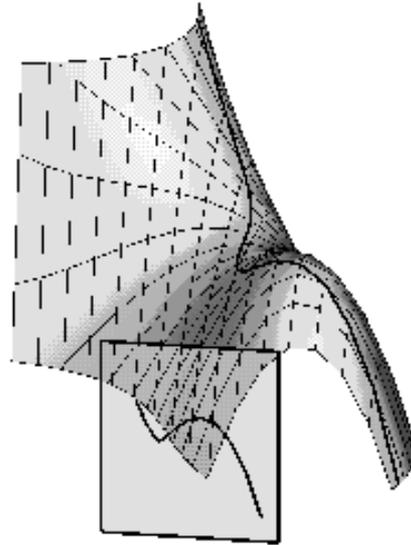

Swallowtail visual event

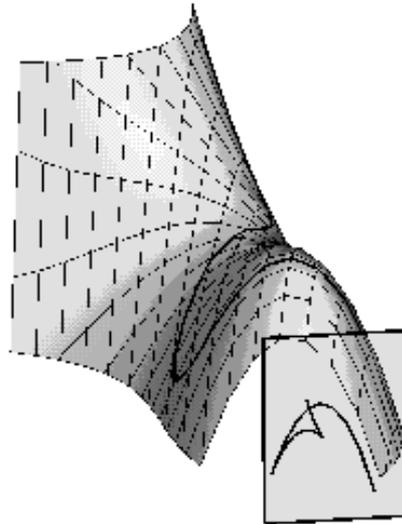

Ray has 2-point contact with surface at contour generator

Swallowtail visual event

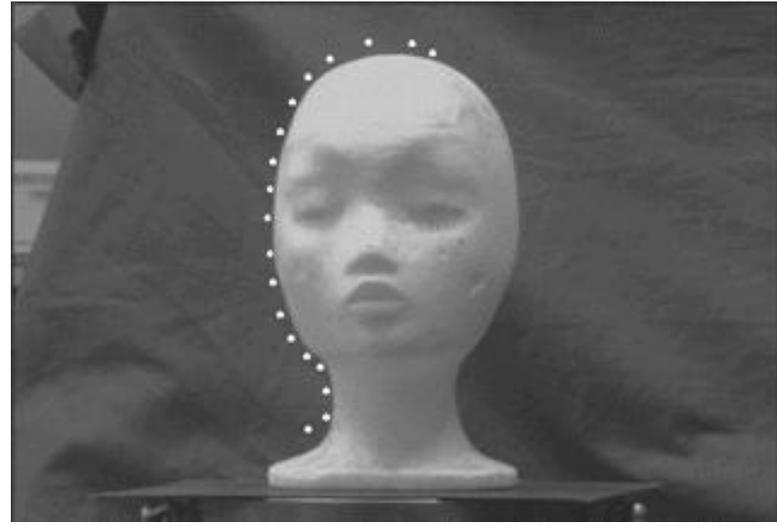

Ray has 4-point contact with surface at flecnodal point

Swallowtail visual event

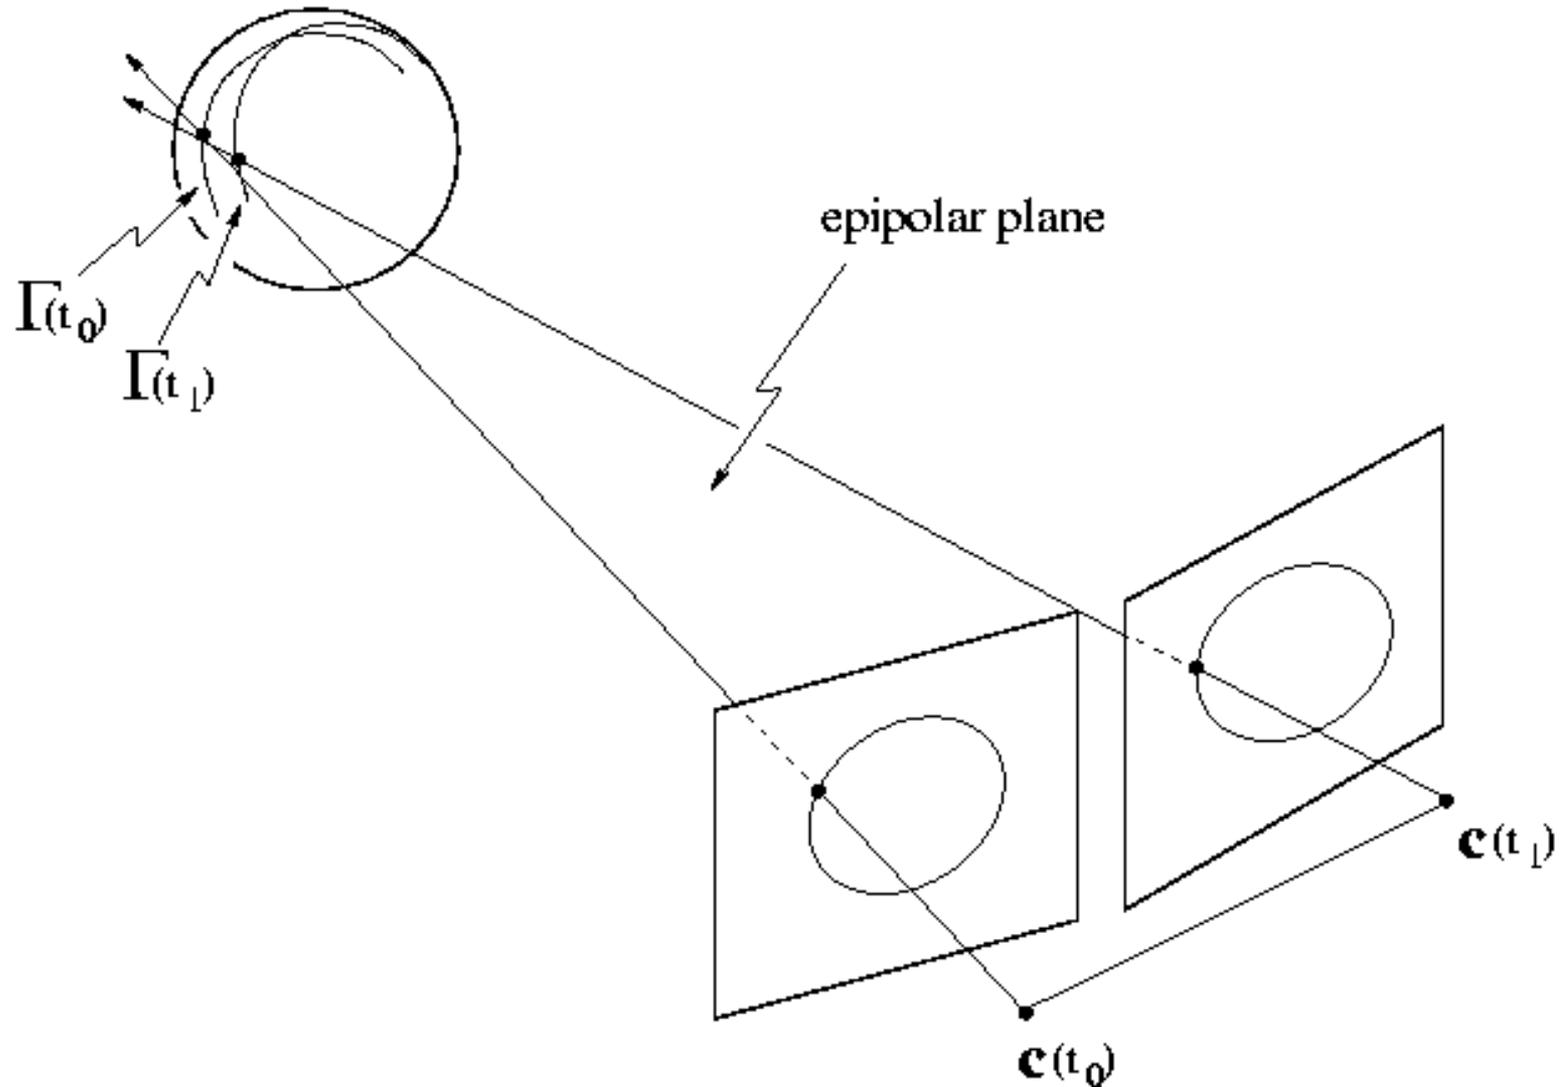

Ray has 3-point contact with surface at cusps of apparent contours

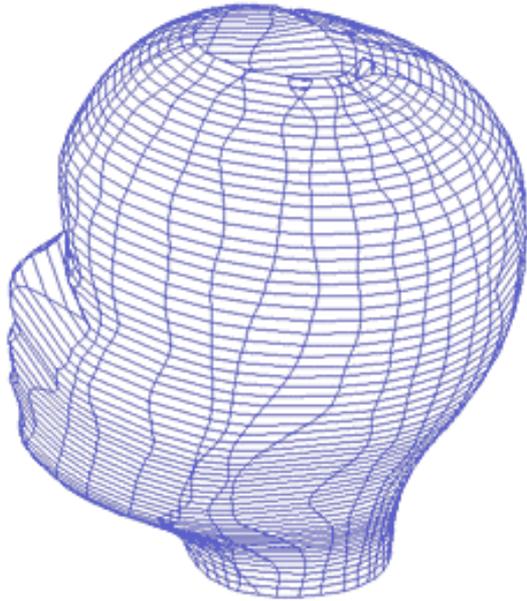

Tracking profiles

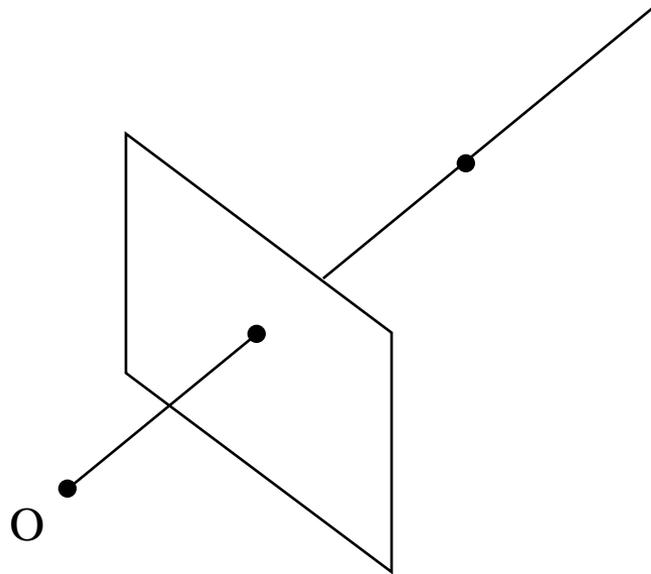

Epipolar Parameterisation

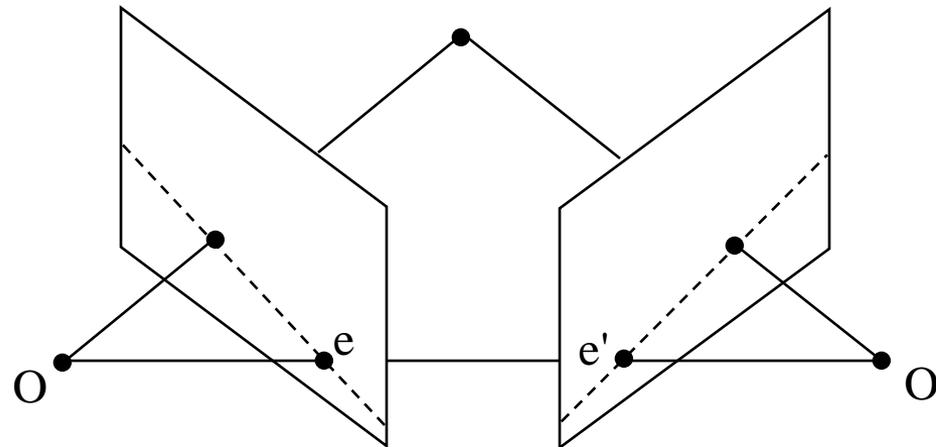

Reconstruction of surfaces

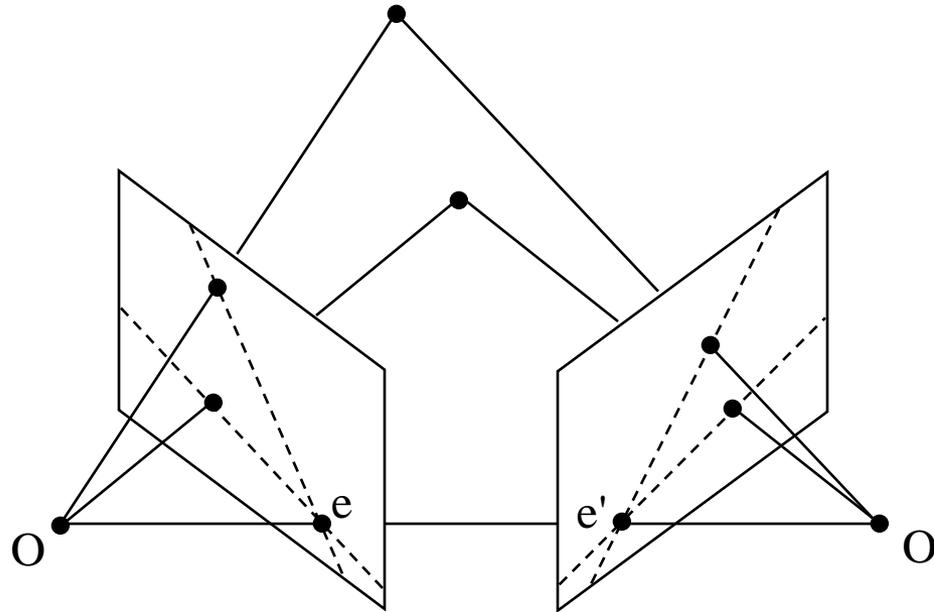

Stereo vision

Stereo vision

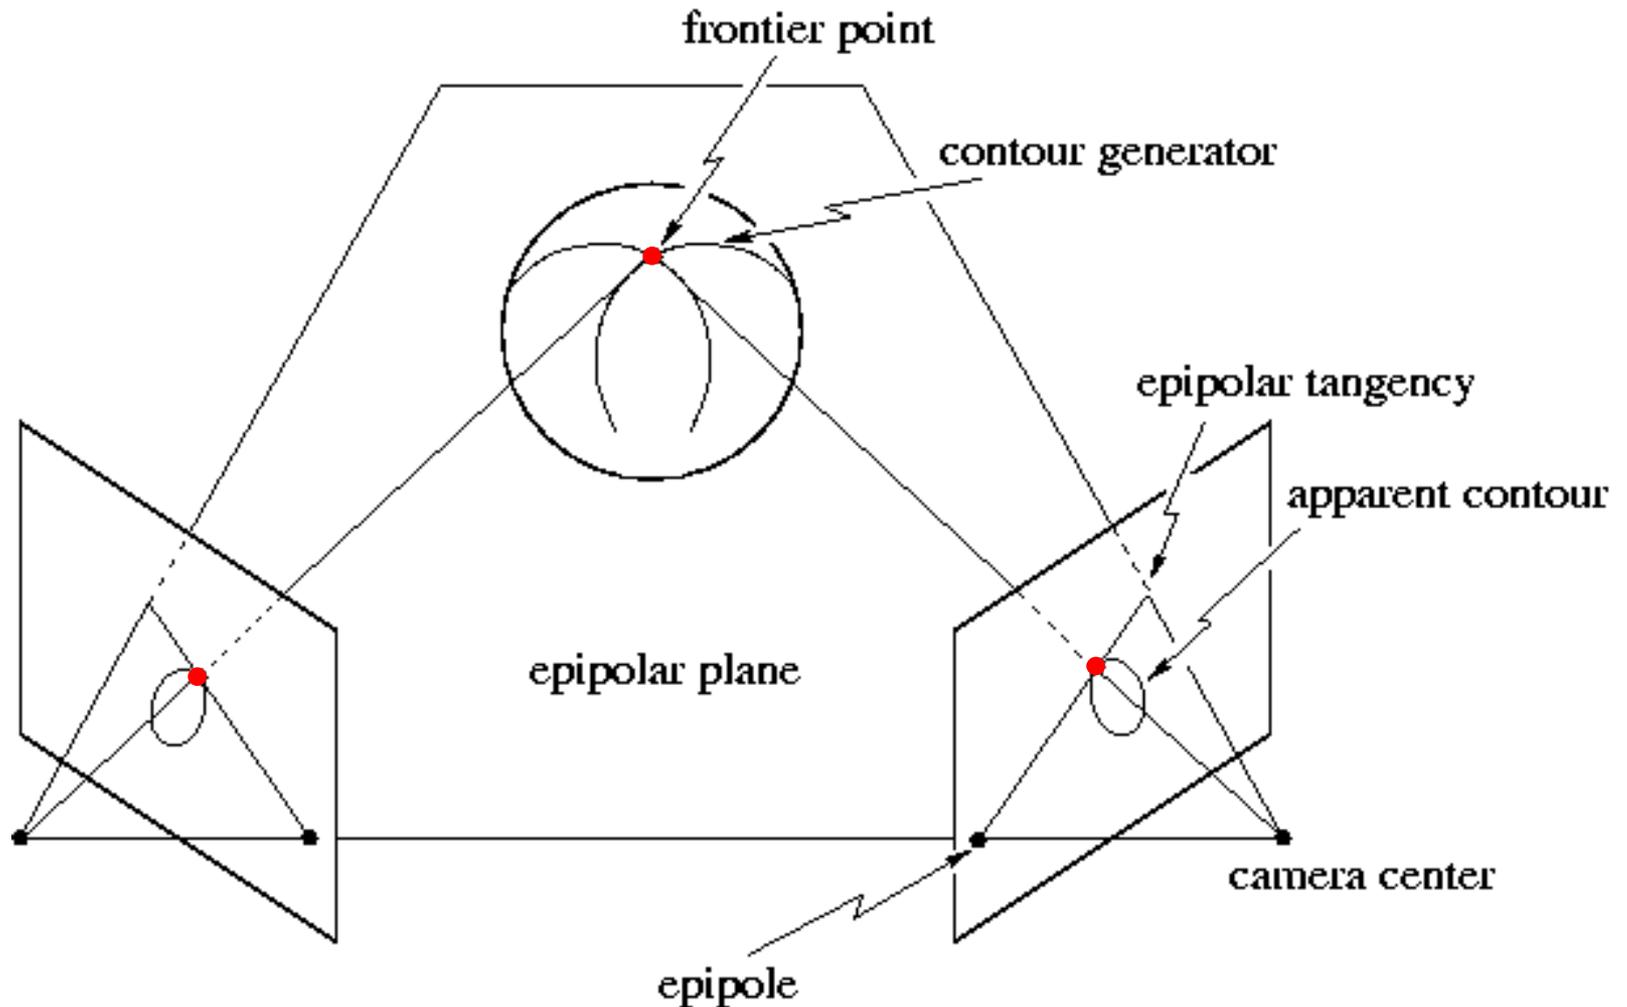

Epipolar geometry

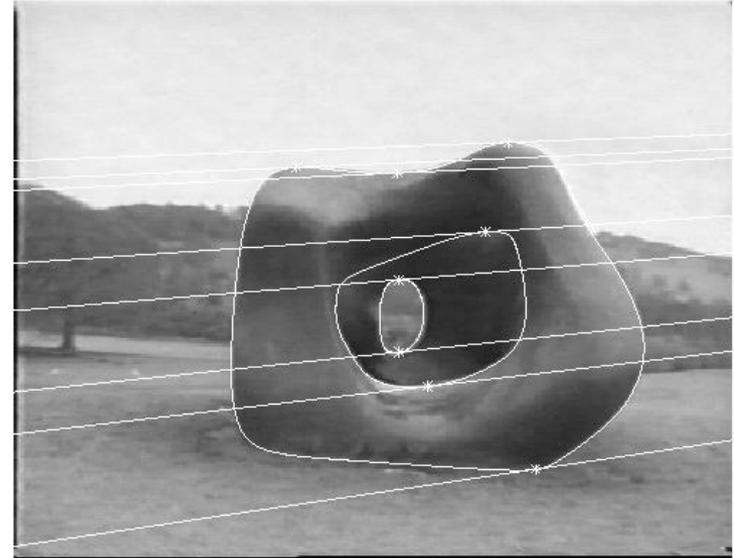

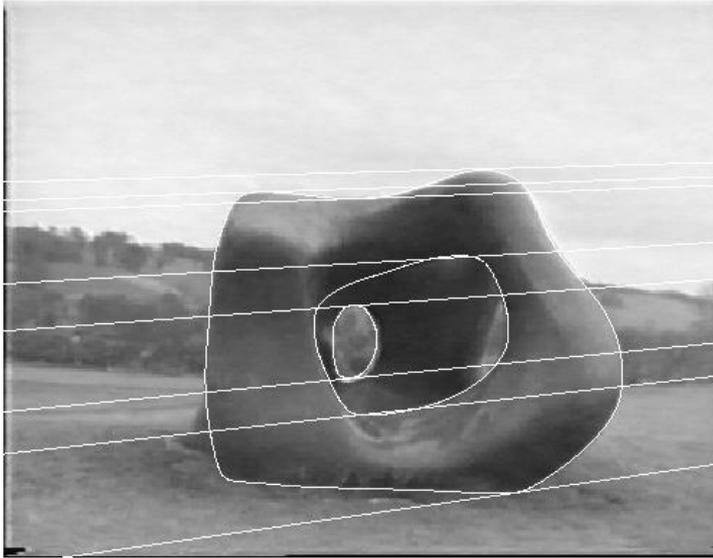

$$\begin{bmatrix} u & v & 1 \end{bmatrix} \begin{bmatrix} F \\ \begin{bmatrix} u' \\ v' \\ 1 \end{bmatrix} \end{bmatrix} = 0$$

Epipolar geometry

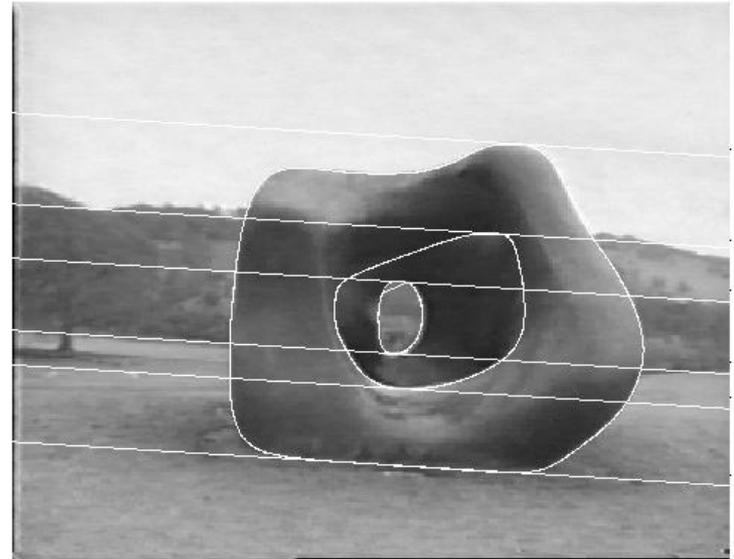

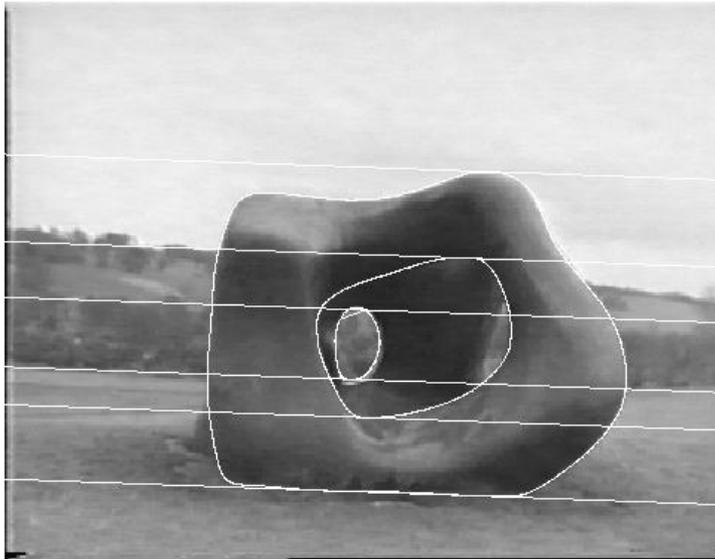

Previous Work

- Epipolar Geometry - **F**:
 - General motion (7 dof):
 - ≥ 7 epipolar tangencies.

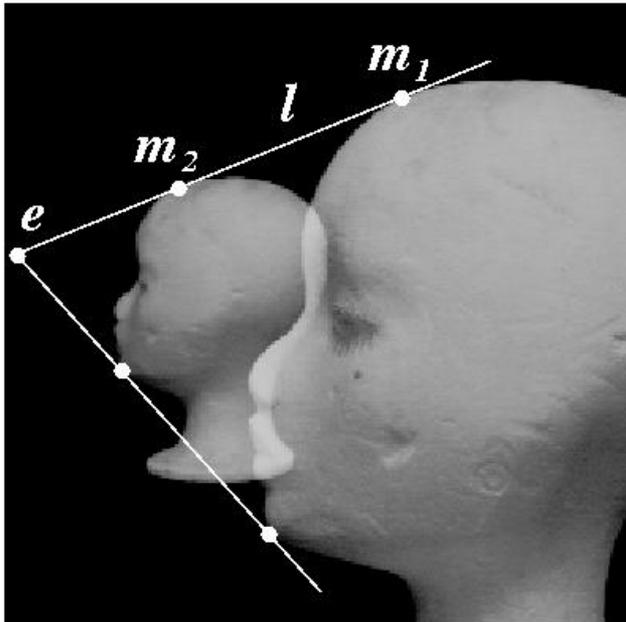

Previous Work

- Epipolar Geometry - **F**:
 - Affine approximation (4 dof):
 - ≥ 4 epipolar tangencies.

Previous Work

- Epipolar Geometry - **F**:
 - Linear motion (2 dof):
 - ≥ 2 epipolar tangencies.

Practical solution

- Epipolar Geometry - **F**:
 - Circular Motion (6 dof):
 - ≥ 2 epipolar tangencies.

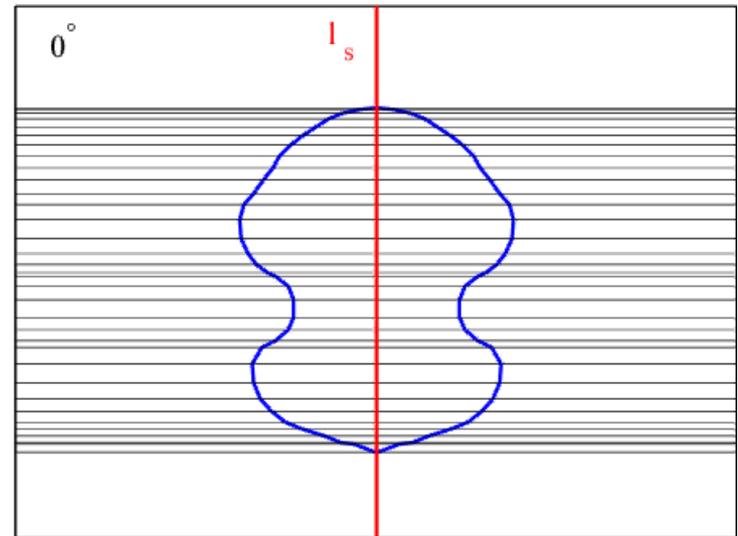

Surfaces of Revolution

Symmetry Transformations

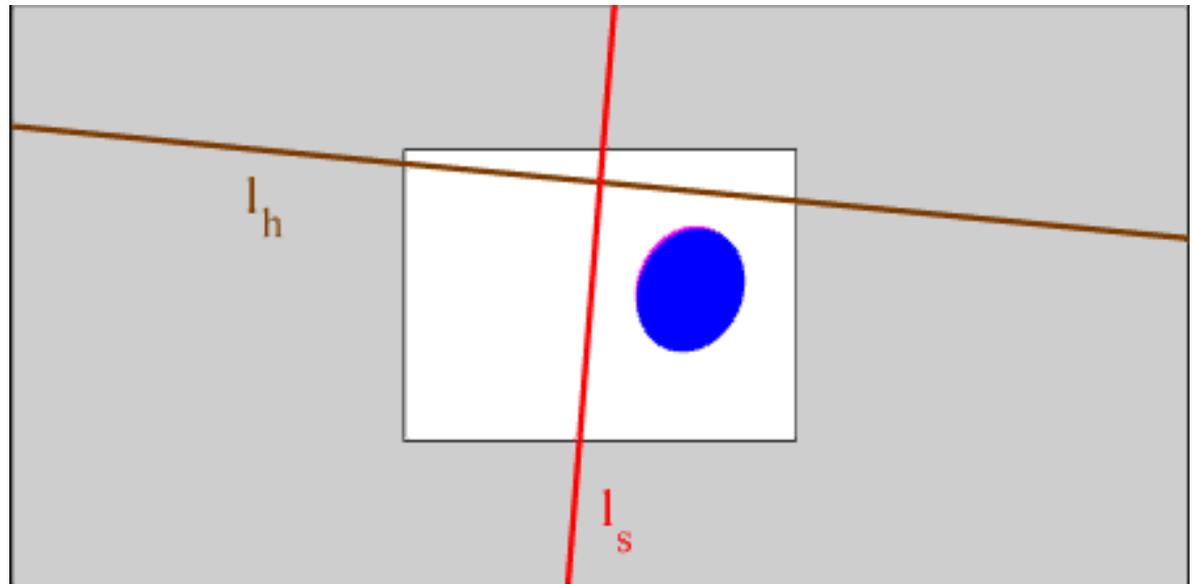

$$\mathbf{W} = \mathbf{I} - 2 \frac{\mathbf{v}_x \mathbf{l}_s^T}{\mathbf{v}_x^T \mathbf{l}_s}$$

Epipolar Geometry

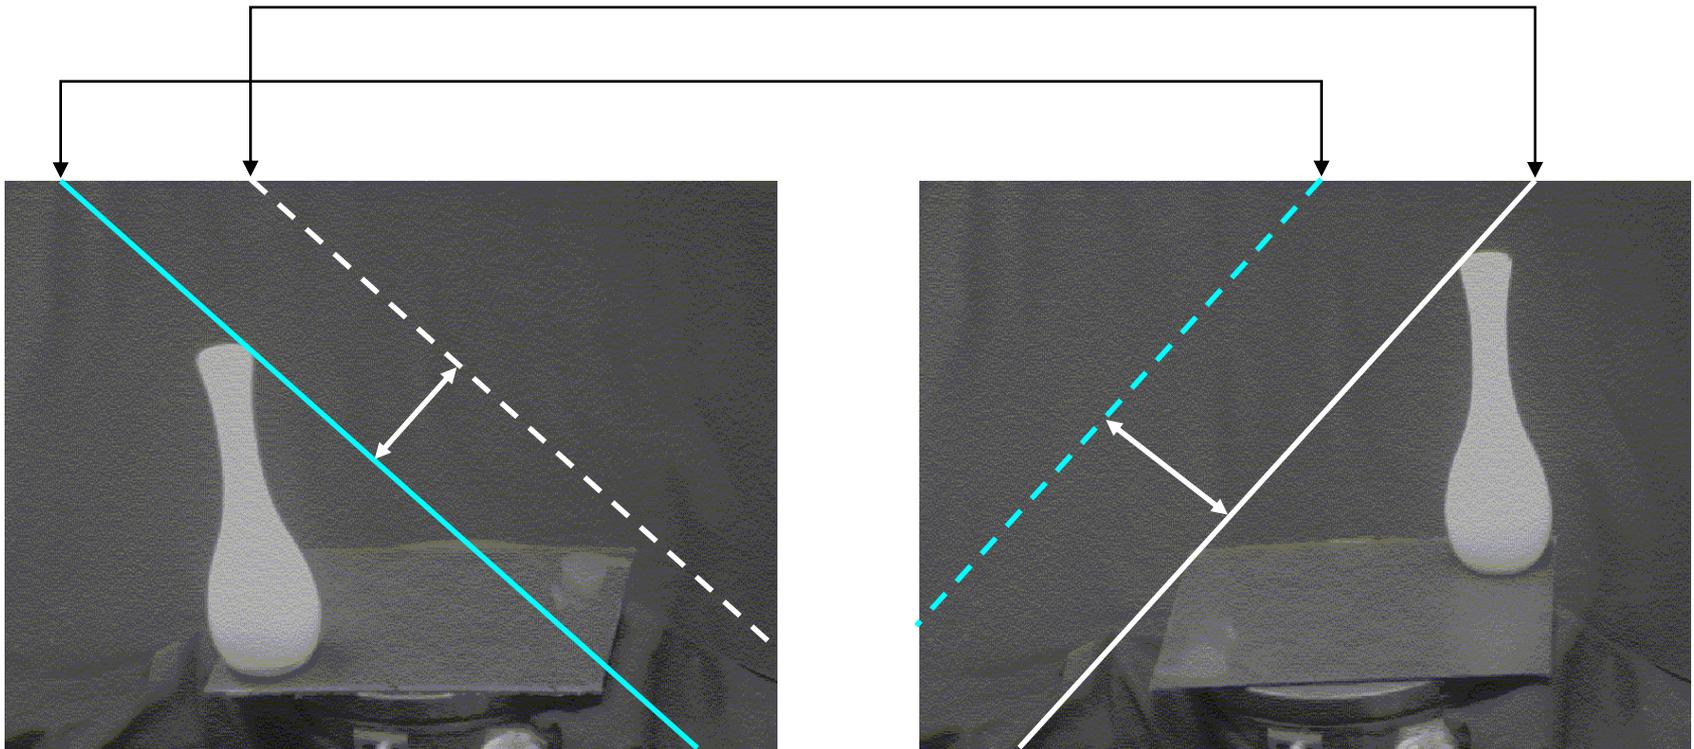

- For circular motion:
 - fixed entities:
 - image of screw axis, horizon, \mathbf{V}_x : 5 d.o.f.
 - epipoles and epipolar lines related by \mathbf{W}

$$\mathbf{F} = [\mathbf{e}]_{\times} \mathbf{W}$$

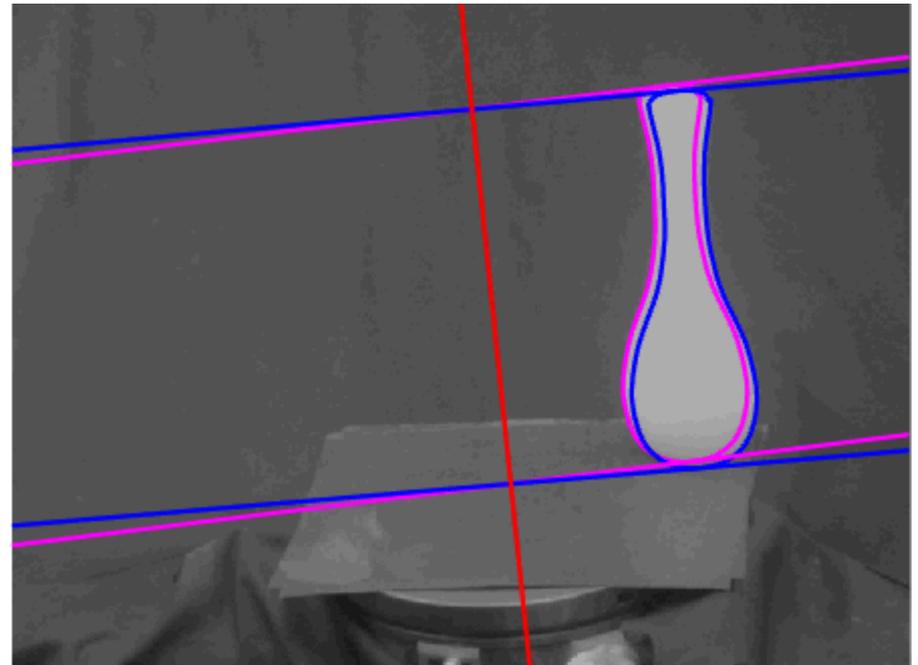

Epipolar Geometry

Geometric error of transferred epipolar lines:

Epipolar Geometry

- Correspondent epipolar tangents:
 - related by \mathbf{W} , intersect at image of screw axis.
- Epipolar tangents in same image:
 - intersect at the epipole.

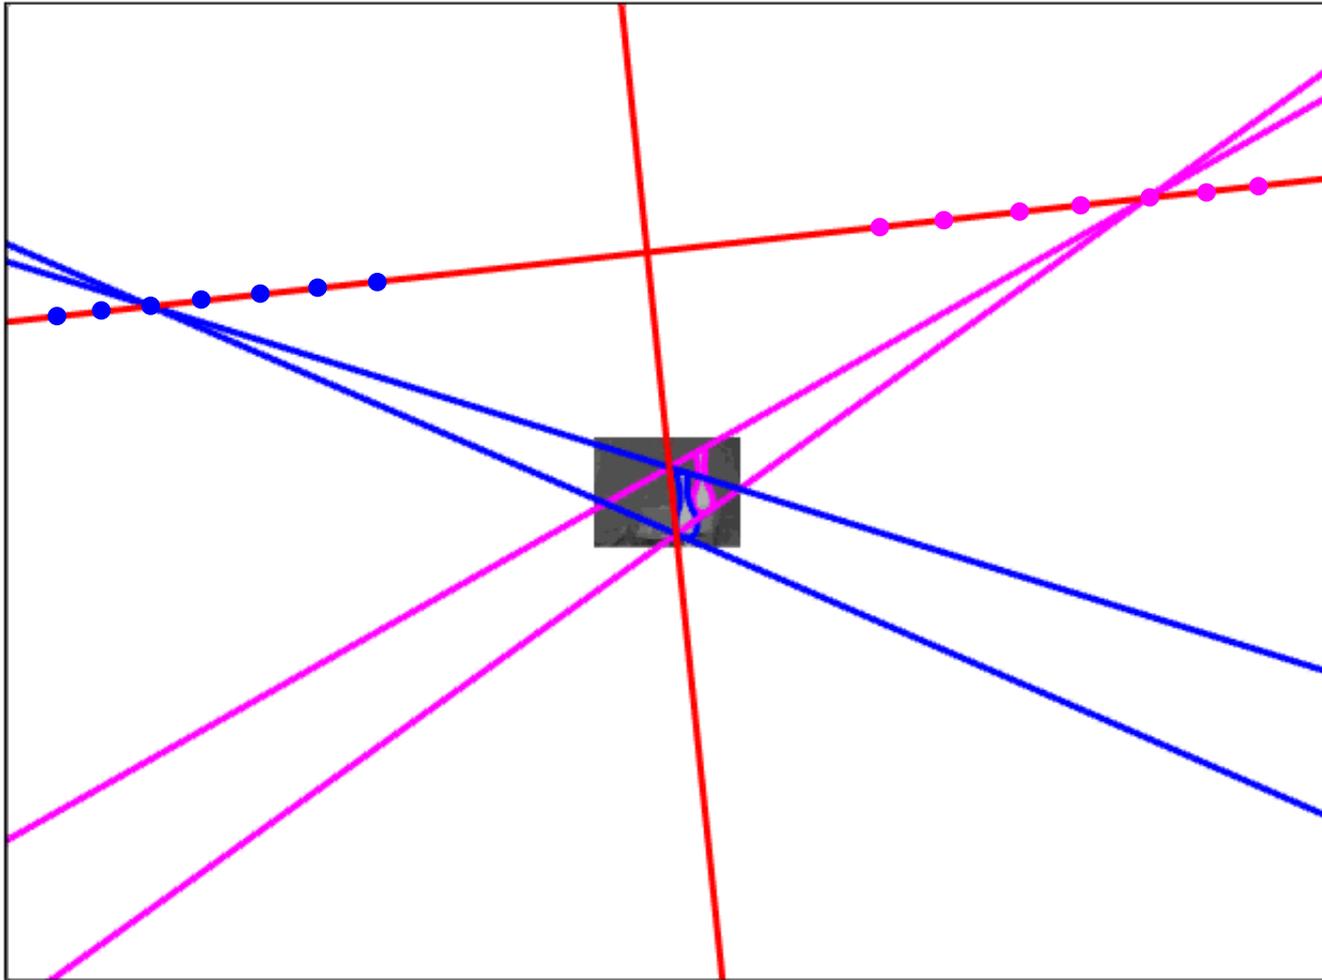

Reparameterization of \mathbf{F}

$$\mathbf{F} = \left[\mathbf{v}_x \right]_{\times} + \mu \tan \frac{\theta}{2} \left(\mathbf{l}_s \mathbf{l}_h^T + \mathbf{l}_h \mathbf{l}_s^T \right)$$

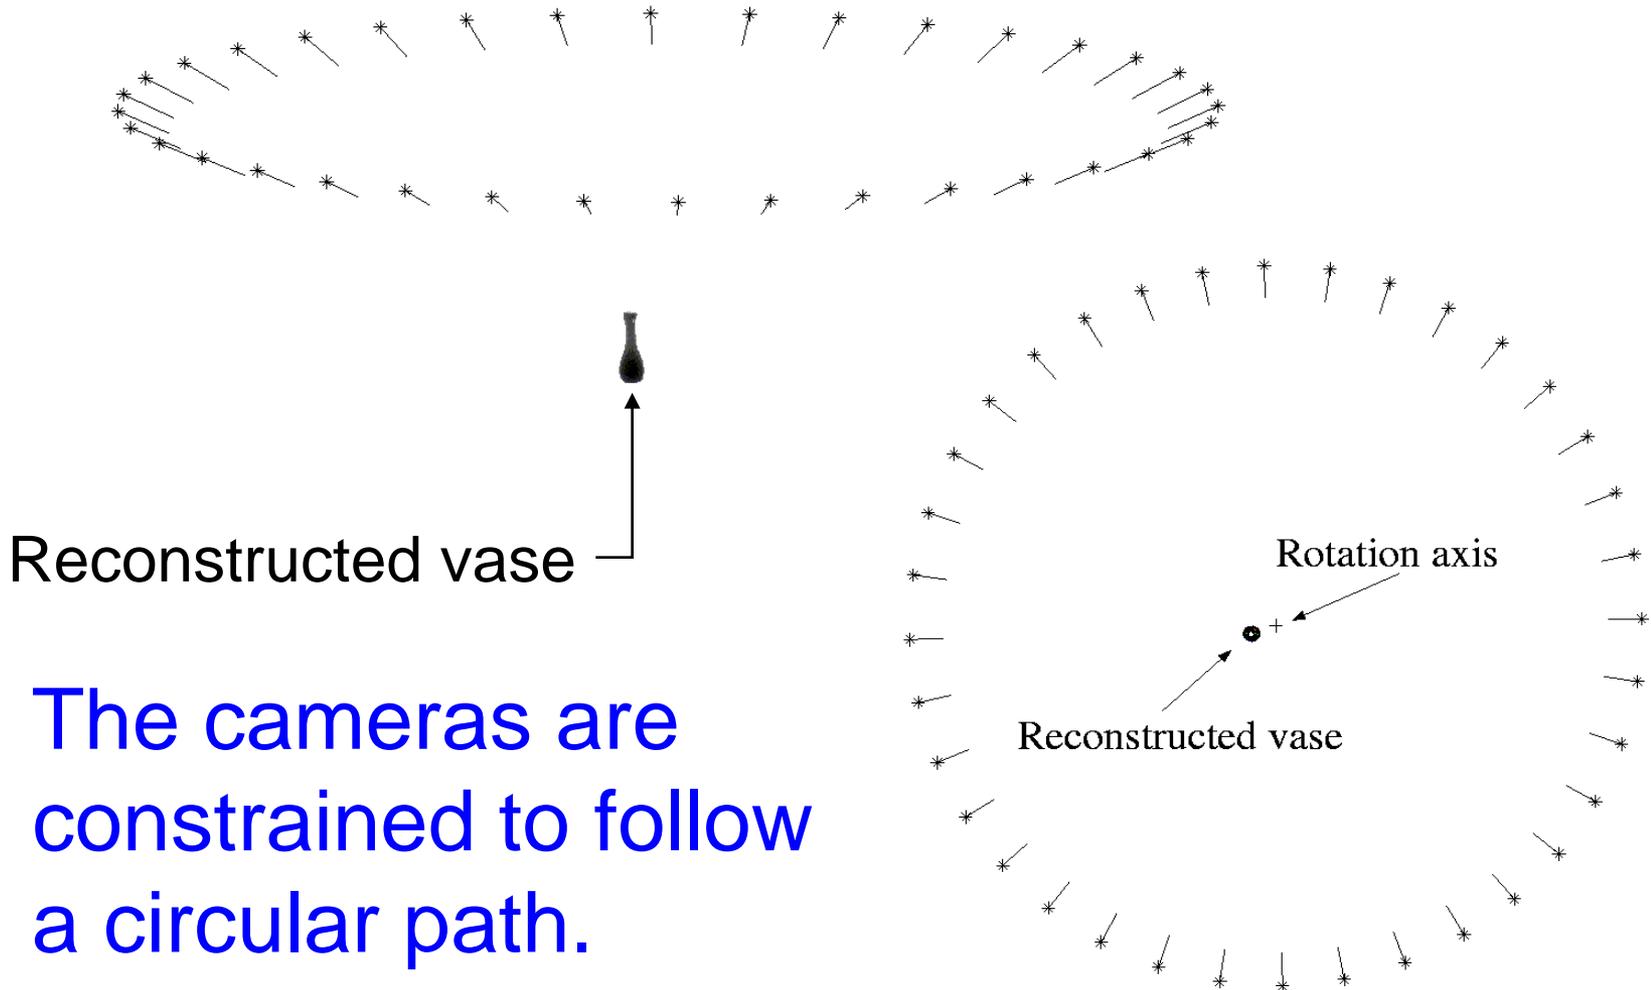

- v_x and l_s - recovered from the harmonic homology;
- l_h - recovered from epipolar constraints.

- **relative scale factor**

Epipolar Geometry

Recovery of motion

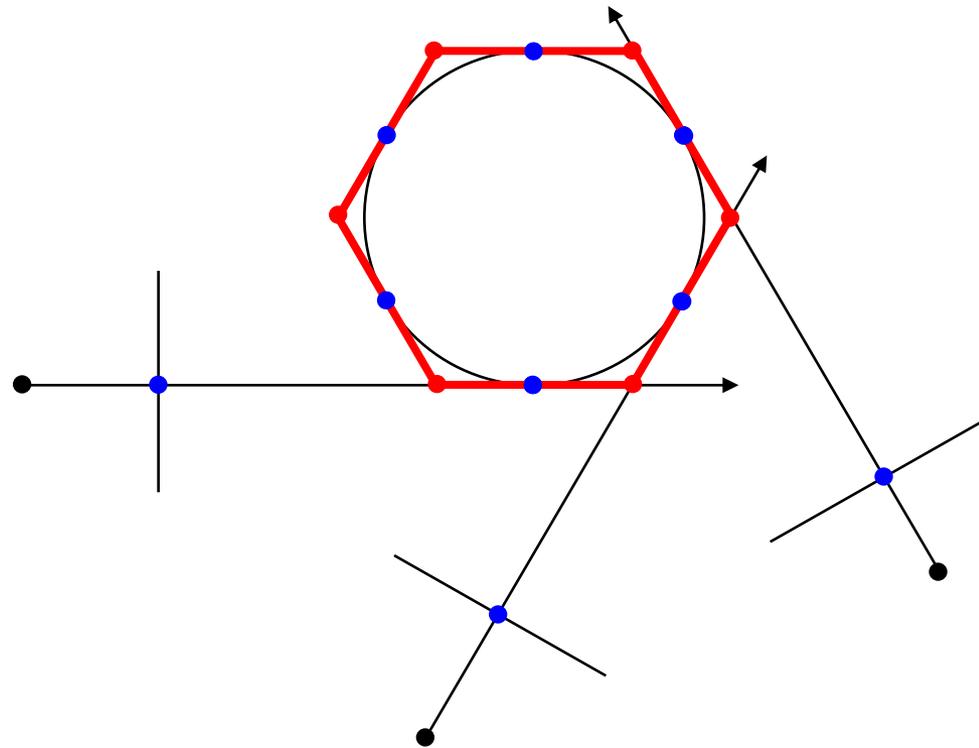

The cameras are constrained to follow a circular path.

Circular motion

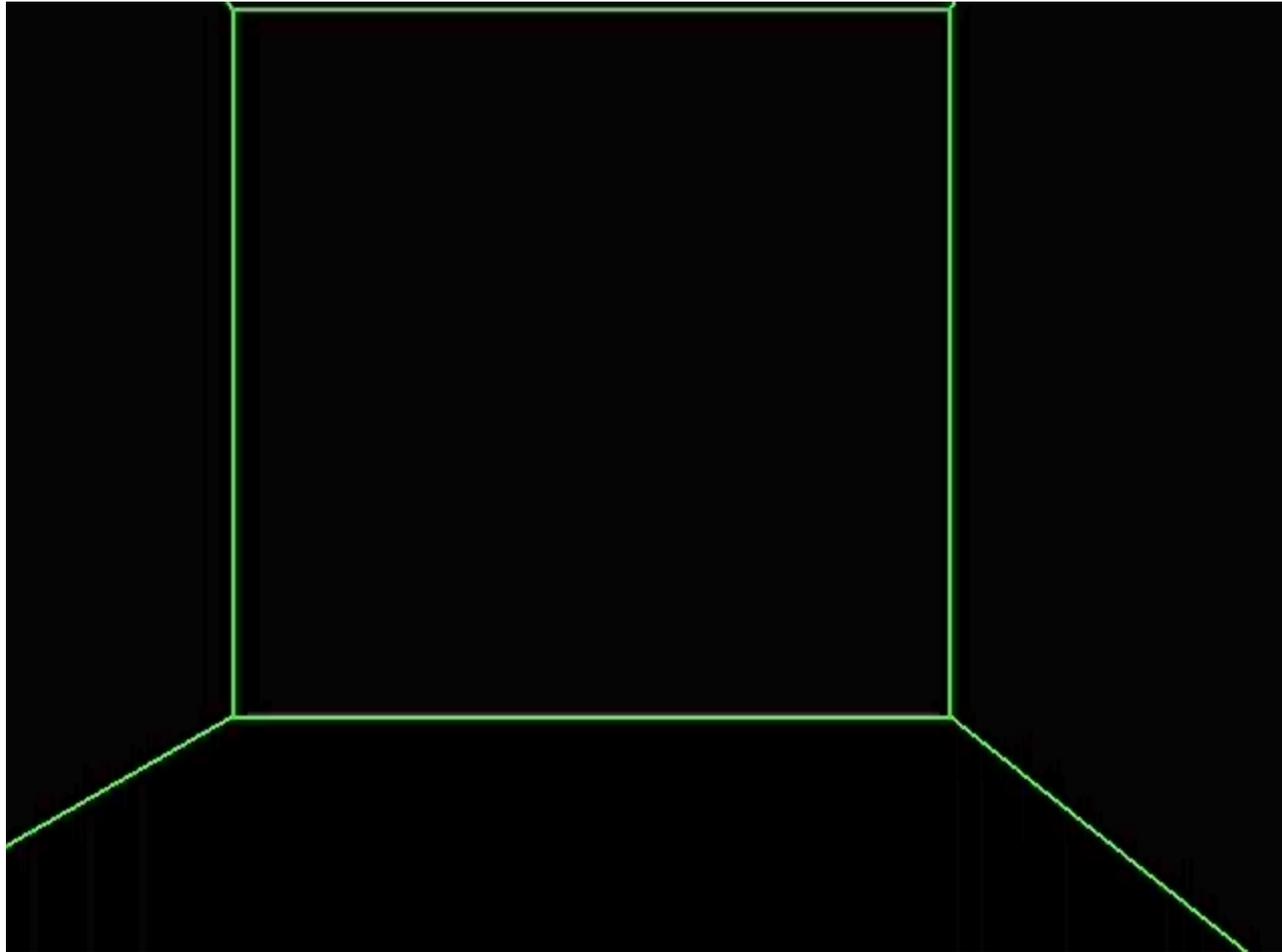

Space-carving

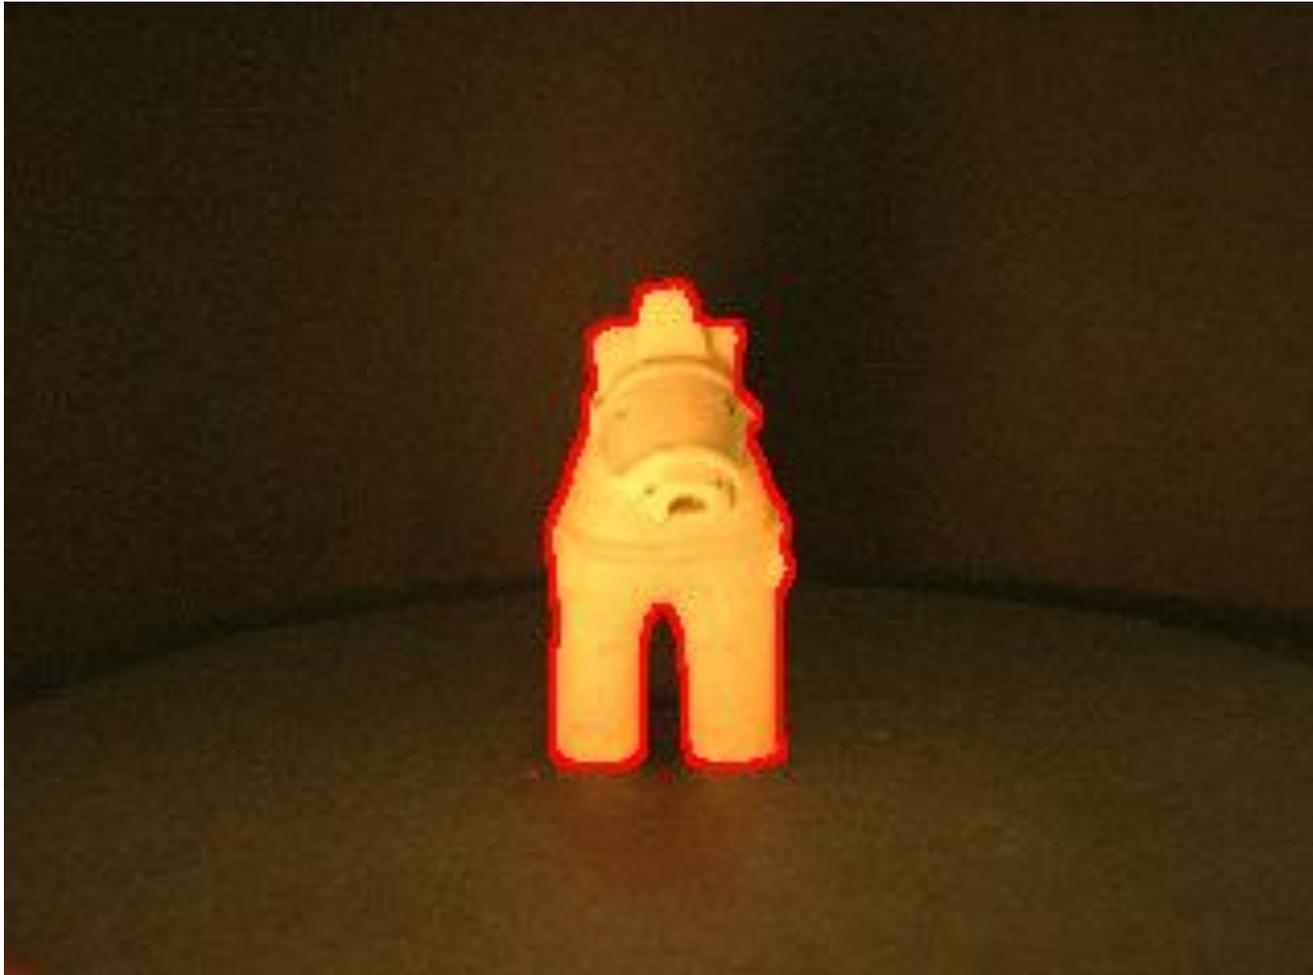

Reconstruction by carving

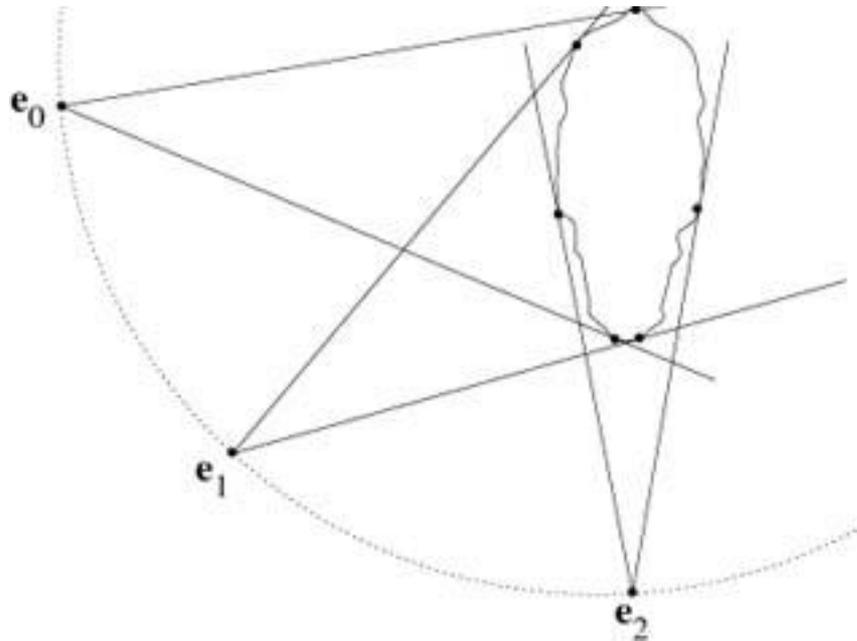

Circular motion is insufficient

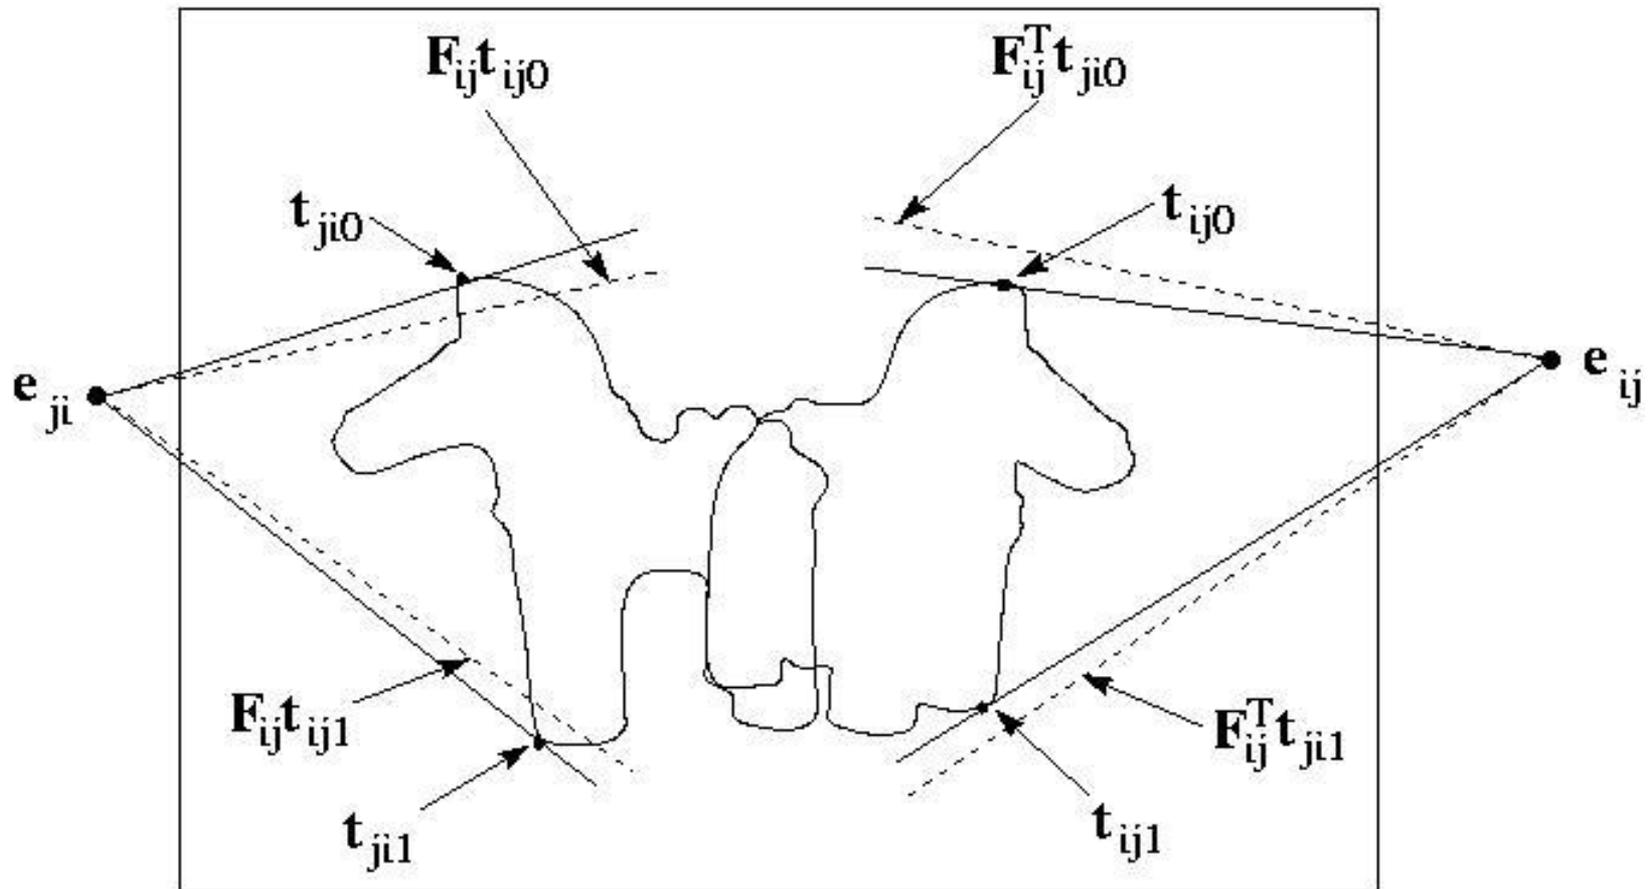

Add arbitrary views

General motion constraints

Estimate general motion

Incrementally improve model

Summary

- Requires only silhouettes.
- Recovery of motion and shape.
- Trivial initialisations for all the optimisations.
- Low-dimension search space.
- Future work:
 - Use shading/stereo/texture to refine models.
 - Physics of reflectance
 - Statistical models for uncertainty
